

 **threadline**

**bringing intelligence to
product development**

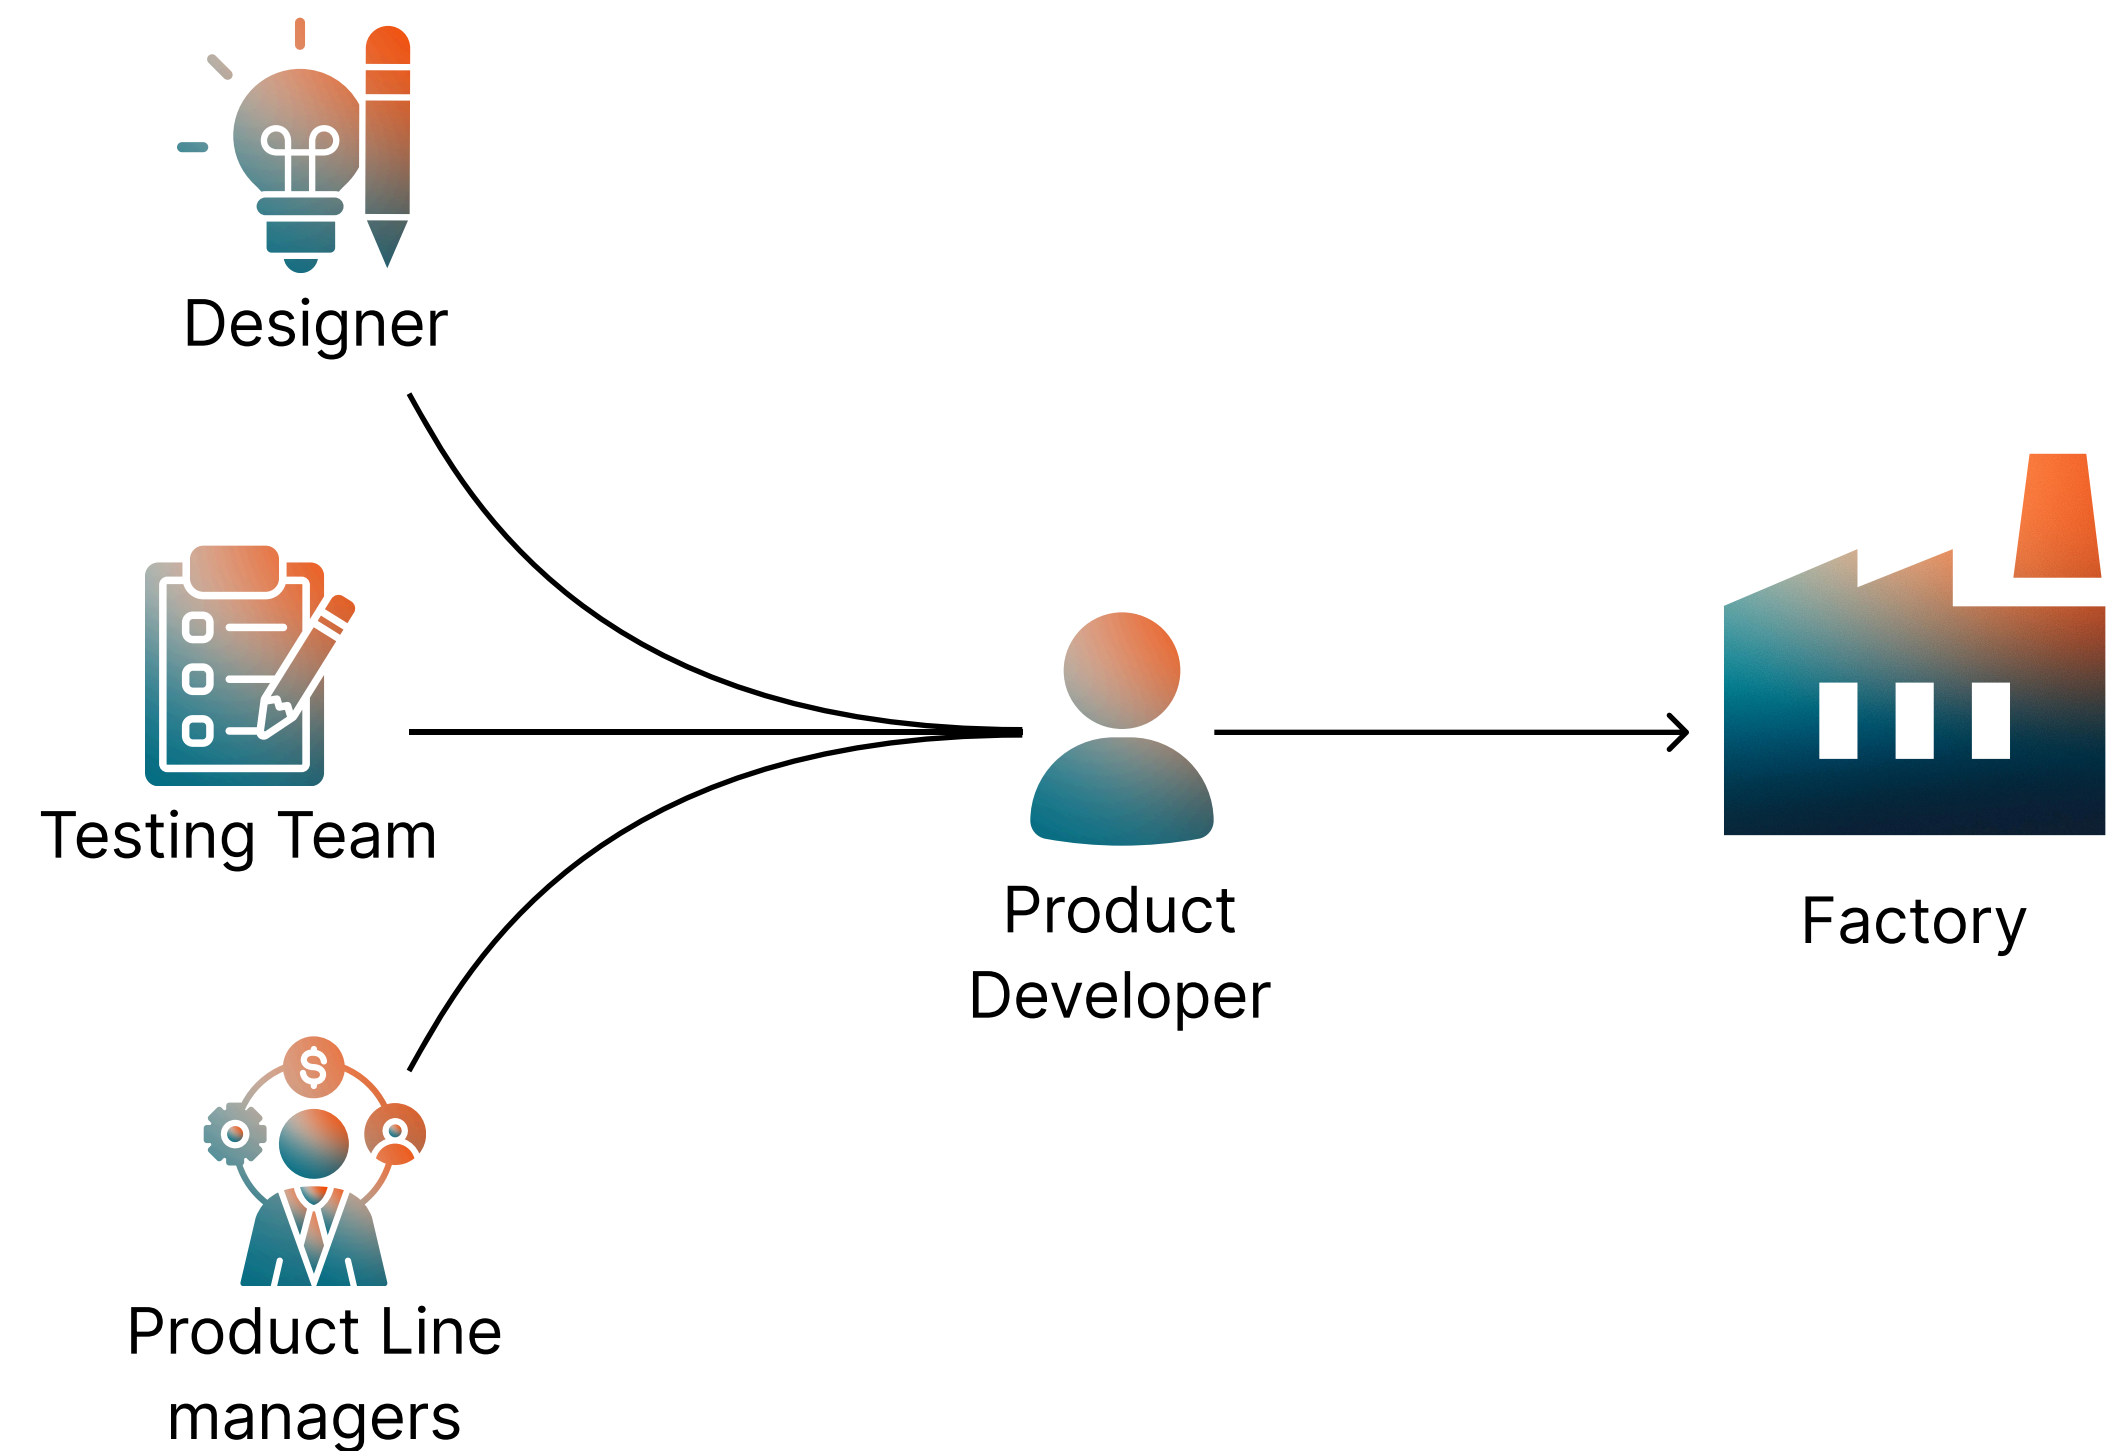

What is Product Development?

Designers are **creative**,
while manufacturers are **practical**

Product developers bridge the gap, turning
concepts into manufacturable goods

It requires multiple rounds of physical samples,
dependant on multiple versions of
manufacturing files and continuous feedback
from manufacturers and designers.

With stakeholders in this process spread across
supply chains and timezones, product
development gets convoluted...

product development is **chaos**

communication is **fragmented**

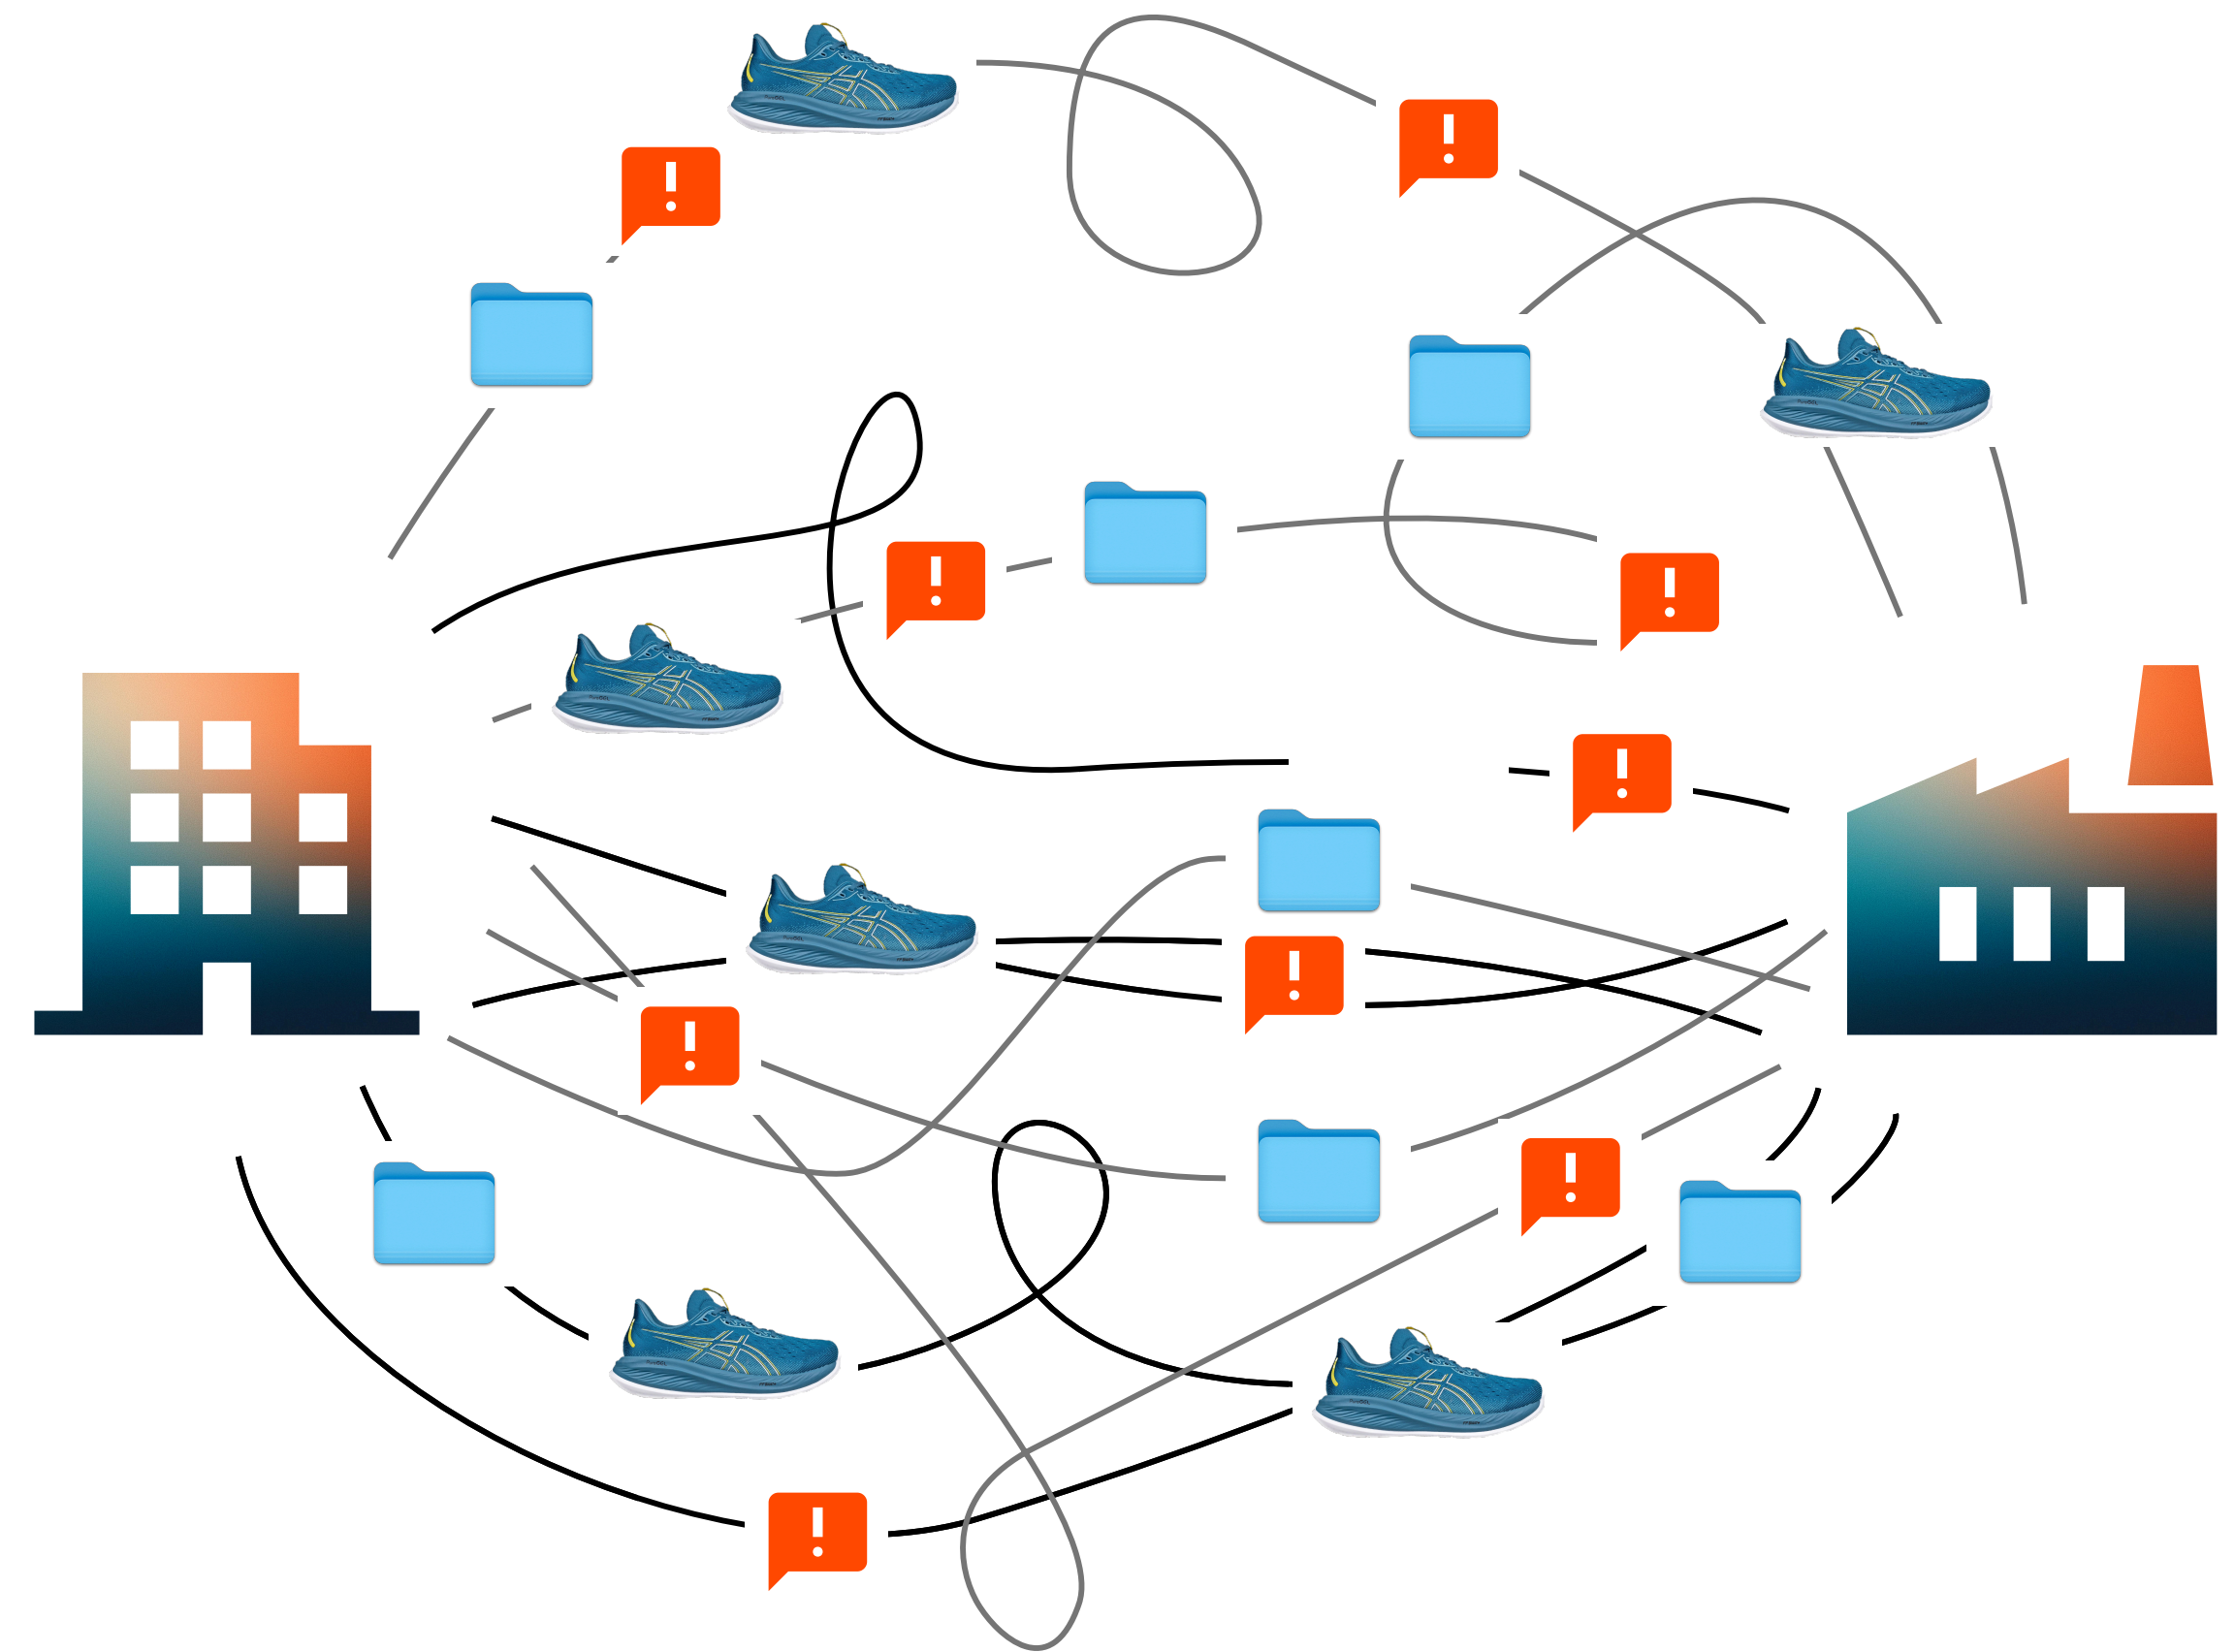

Communications and files are spread across many channels and platforms, such as email, Teams chat, weChat and WhatsApp

information is **messy**

Information is shared ad-hoc in unstructured formats

versions are **non-controlled**

Version control is either archaic or non-existent

This was Alice, our founder's, experience with Product Development

Speaking to over 100 people from top brands, on all sides of the process confirmed her experience **isn't unique**

We spoke with:

- Designers
- Developers
- Local operators
- Line managers
- C-suite stakeholders

PUMA

Bata

M&S

AXEL ARIGATO

And found **confusing communications** and **lost data** is the norm across industries

ual:

NEW
LOOK

Through our outreach, we gathered the scope of the problem

We heard about mistakes that cost

£100,000

because of one incorrectly named file

Due to a web of data and management software, data from one team is re-entered

15
times

...across

20+
platforms

Developers trying to stay up to date with both designers and manufacturers often deal with

100
email chains

...all with

30
people in cc

We estimate a company like Nike spends more than

 **£50m**
per year through
these inefficiencies*

**Based on bottom-up estimate*

Our Features

Localised Feedback and Comms

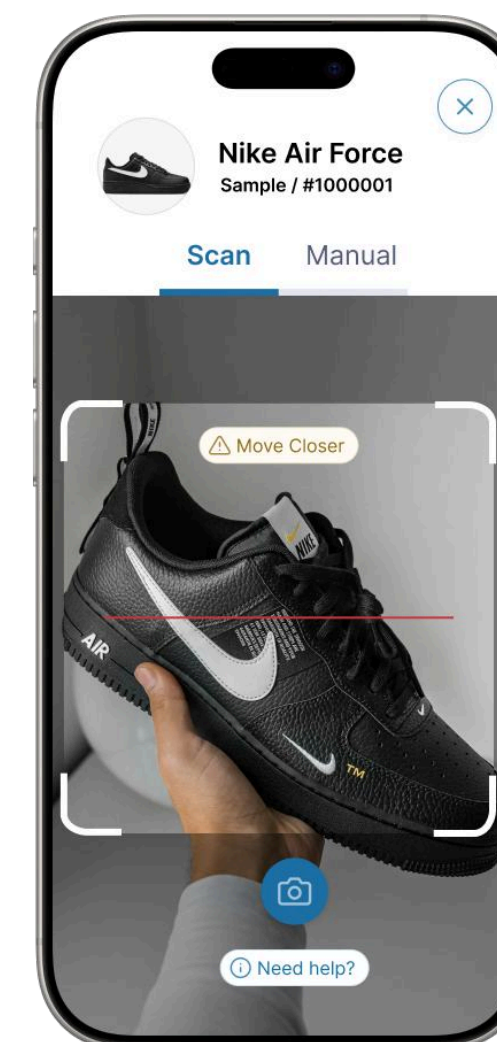

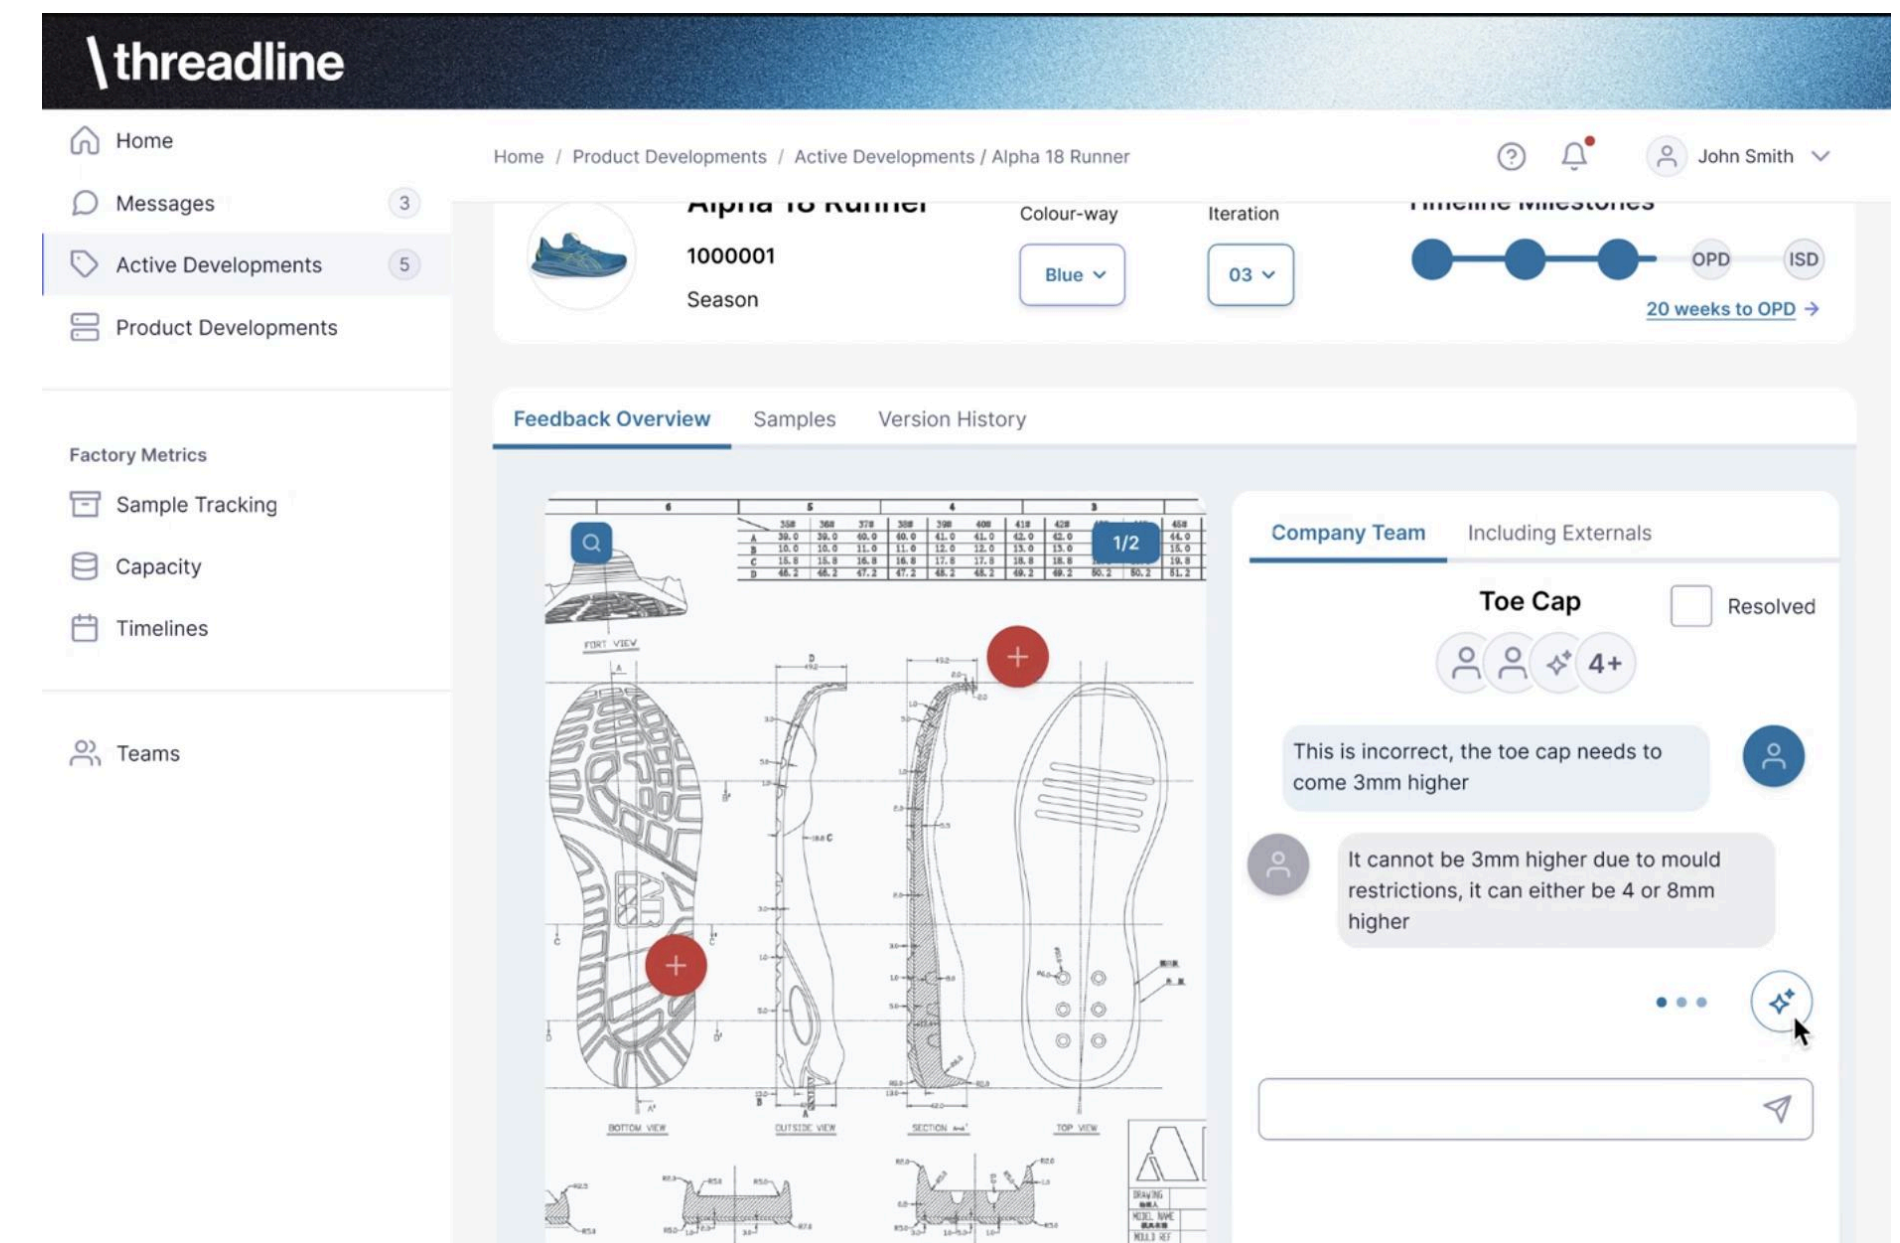

Developers and manufacturers share feedback on samples and designs directly from their phones, uploading photos and adding annotations. Conversations stay linked to products, with smart **chat prioritisation and summaries** minimising notification overload.

Version Control

Files on our platform are automatically **categorised** and **version controlled**, while metadata and colour data is intelligently extracted to populate databases

Error Checking

Our RAG model builds a company-specific knowledge base, allowing for automated **error flagging** on documents and designs, and insights in chats.

Initial Trials and **User Feedback**

We trialled our MVP with developers, designers, and managers at leading brands.

“I spent two weeks in the last [product line review] checking for inconsistencies and errors across techpacks... so error checking is amazing”

Steven, Product Developer @ Puma

“We are constantly bombarded with chats. Prioritising and summarising is great”

Geraint, Product Developer @ Puma

“This is what PLM should be - clean and refined, yet advanced”

Lars, Product Developer @ Puma

“Localised feedback is great, and a phone interface is key. People are fired for having images of samples on their camera roll”

Joanne, Ex. Innovation @ Nike

“I was hired because I'm passionate about great products. I love threadline because I can spend less time on admin and more on what I love; making boots that work for people”

Steven, Product Dev @ Puma

“Mismatched documents and errors which should be caught before hand account for a large proportion of the time and costs in development”

Tom, Product Developer and Sourcing @ Brand Collective

PUMA

AXEL ARIGATO

Why **Now**

Post COVID workplaces

Industries have been forced to develop new digital design and collaboration tools to maintain remote working productivity.

EU Green Claims Directive expected in 2026

New legislation mandates future requirements. Developers will need logs of materials, technical information, and complete transparency over their convoluted development processes.

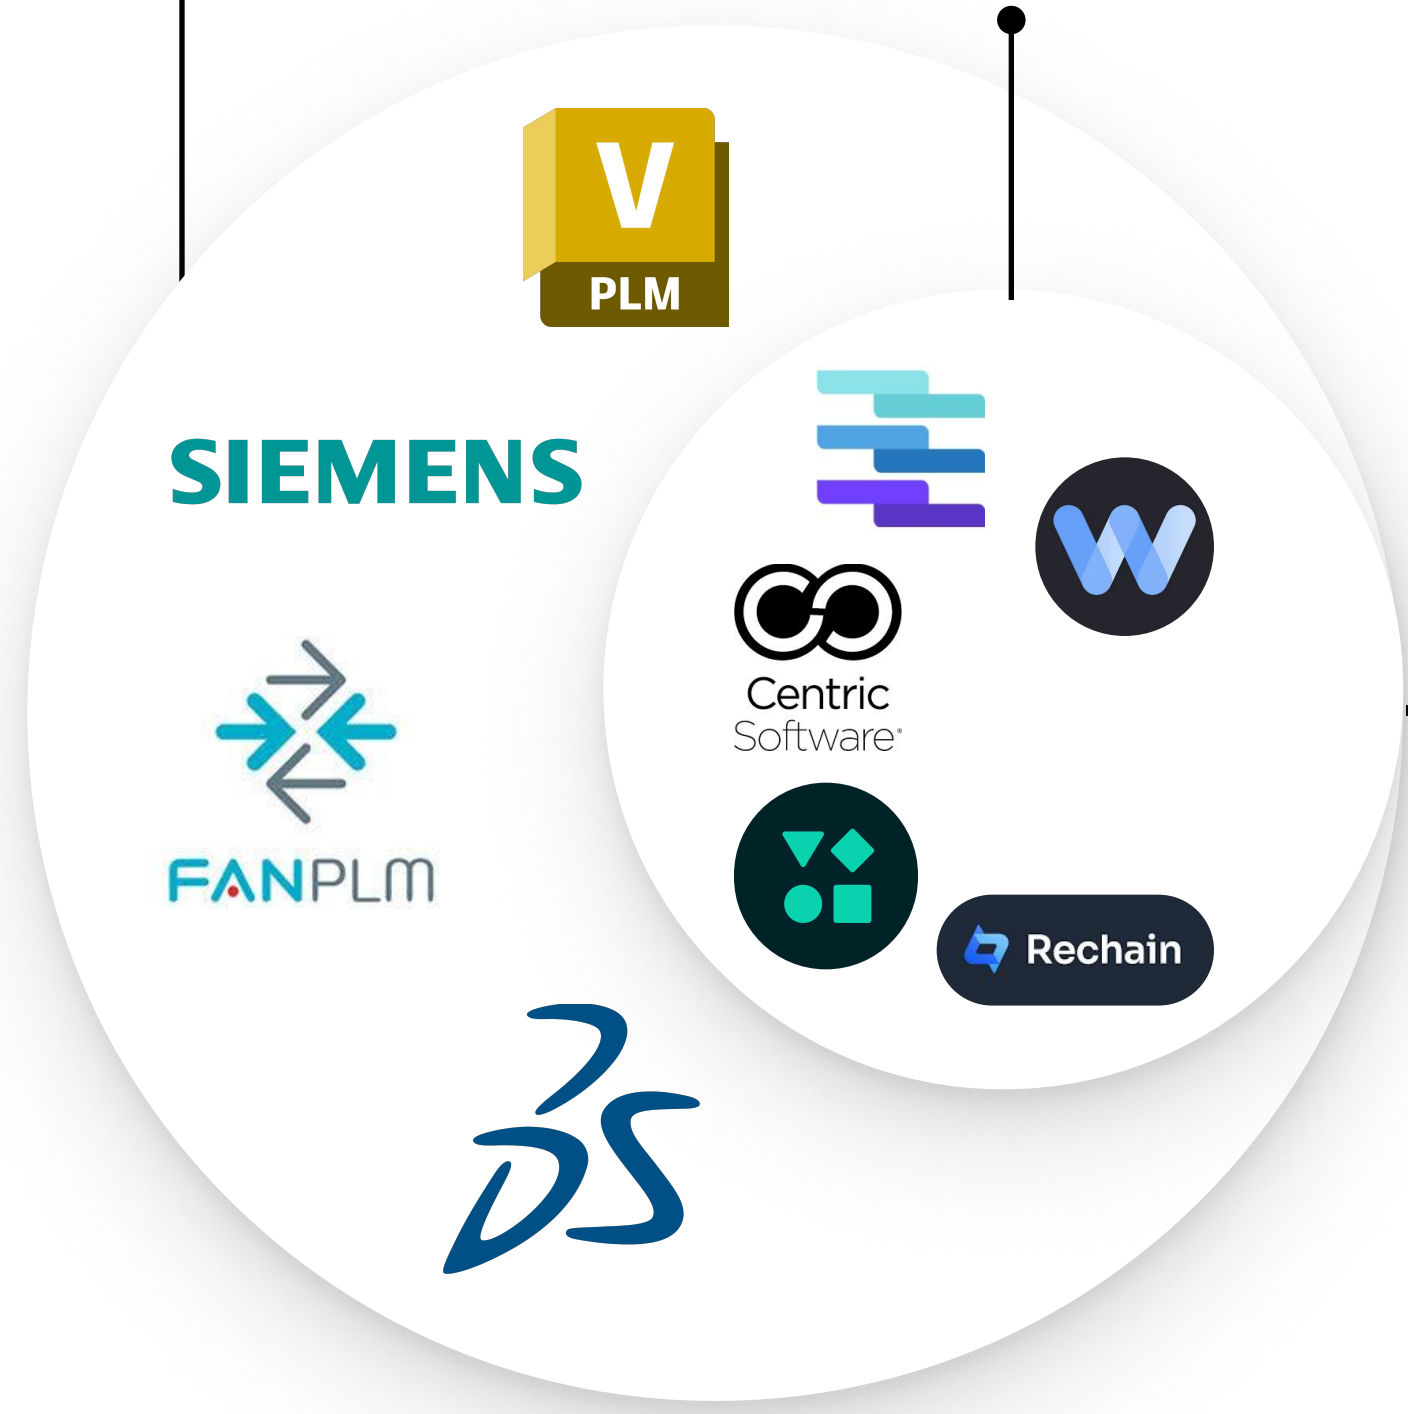

Efficiency and automation

As AI is increasingly leveraged for improved output, but has yet to come to product developers.

Product Line Management (PLM) platforms

Threadline

- Unique Features:**
- Mobile PLM communications
 - Automated data harvesting from files
 - Chat organisation by product
 - Automatic version control
 - Automated error catching

Generic tools lack data integrations and don't fit smoothly into workflows

Generic Collaboration Tools with Integrations

Communication and Feedback

Generic communications tools are messy and not suited for iterative file sharing

pricing

Curate

PLM platform

Up to 50 active products
Or 500 active articles

No AI error checking or RAG

Price per user per month £30

Price for 50 additional
active products of 500
active articles per user
per month £10

Grow

Everything in **Curate**

In-built AI error checking for
designers and developers

Self service API integration

Price per user per month £50

Price for 50 additional
active products of 500
active articles per user
per month £8

Enterprise

Everything in **Grow**
